Instruction manual Volume 1
1 Safety and the environment

Avoiding electrical hazards
> Never use the instrument and connected probes to measure on or near live parts!
> Damaged mains cables must only be replaced by authorized personnel.
> Only have the transmitter wired and connected by authorized personnel with the voltage disconnected.
> You must always comply with the regulations applicable in your country for opening and repairing electrical equipment.

Avoiding personal injury and damage to equipment
> Installation, setting and calibration work must only be carried out by qualified and authorized personnel!
> Only open the instrument when this is expressly described in the instruction manual for installation, maintenance or repair purposes.
> Observe the permissible storage, transport and operating temperature.
> Do not store the product together with solvents. Do not use any desiccants.
> Do not use the instrument for control purposes at the same time as operating or servicing the transmitter.
> Only operate the product properly, for its intended purpose and within the parameters specified in the technical data. Do not use any force.
> Carry out only the maintenance and repair work on this instrument that is described in the documentation. Follow the prescribed steps exactly. Use only original spare parts from Testo.

Any additional work must only be carried out by authorized personnel. Otherwise testo will not accept any responsibility for the proper functioning of the instrument after repair and for the validity of certifications.
Protecting the environment

> At the end of its useful life, send the product to the separate collection for electric and electronic devices (observe local regulations) or return the product to Testo for disposal.

2 About this document

Use

> Please read this documentation through carefully and familiarize yourself with the product before putting it to use. Pay particular attention to the safety instructions and warning advice in order to prevent injuries and damage to the products.

> Keep this document to hand so that you can refer to it when necessary.

> Hand this documentation on to any subsequent users of the product.

WARNING Indicates potential serious injuries

CAUTION indicates potential minor injuries

Symbols and writing standards

4 Transmitter

4.1 Specifications

4.1.1 Functions and use

The testo 6381 transmitter with Ethernet module is used together with the plug-in, adjusted probes from the testo 6610 family.

Please refer to volume 2, testo 6610 probes, page 93 for information about commissioning, operating and maintaining the testo 6610 probe.

The testo 6381 transmitter is suitable for the following applications with Ethernet networking, amongst others:

- Clean rooms
- Test benches
- Drying processes
- Filling processes
- Painting systems
- Monitoring flow velocities or volumetric flow rates in air conditioning systems

In addition to the signal transmission of the readings to a control unit via analog outputs, the measurement data can simultaneously be recorded, documented and visualized via Ethernet. Furthermore, it is possible to issue an alarm for those responsible for the process, if necessary.

4.1.2 Scope of delivery

The scope of delivery of the testo 6381 transmitter includes the following:

- Key cover
- Rear panel bracket
- Ethernet module
- Instruction manual
- Calibration report
- CD-ROM with operating instructions (PDF), configuration files for Ethernet module and P2A update (this can only be used in conjunction with the P2A software, which has to be ordered separately).
4.1.3. Accessories

The following accessories are available for the testo 6381 transmitter, amongst others:

- Protection caps for probes
- Mains unit
- P2A software (parameterizing, adjusting and analyzing software)
- Assembly accessories

Information about accessories and their order numbers can be found in volume 2, *Accessories and spare parts* or on the website at www.testo.com.

4.1.4. Technical data

Parameters

- Differential pressure
- Humidity (various variables and units)
- Temperature (°C/°F)

**Differential pressure accuracy**

The specifications are only valid if the positive pressure is applied at the positive pressure connection.

- 0.5 % of measuring range, additional 0.3 Pa intrinsic error
- $T_K \text{ slope drift} = 0.03 \%$ of measuring range per degree Kelvin of deviation from nominal temperature 22 °C
- $T_K \text{ zeroing drift} = 0 \%$, as zeroing with solenoid valve

---

1 Measuring uncertainty in accordance with GUM: ±0.8 % of measuring range final value ±0.3 Pa.

GUM (Guide to the Expression of Uncertainty in Measurement): ISO guideline for determining the measuring uncertainty in order to render global measurement results comparable.

The following uncertainties are used during the inquiry:

- Hysteresis
- Linearity
- Reproducibility
- Adjustment area/factory calibration
- Test location
Humidity and temperature accuracy

- Depends on probe

Upon delivery and following a factory reset the readings are shown in the display in the unit that was ordered via the KMAT option Fxx, see Ordering options for 6381 transmitter (0555 6381), page 165.

Humidity and temperature measuring range

- Depends on probe

2 Minor mixtures of the media may occur at the positive and negative pressure side due to the automatic zeroing cycle.
Humidity and temperature resolution
- 0.1 % RH or 0.01 °C/0.01 °F

Meas. cycle
- 1/sec

Interface
- Mini-DIN for P2A software (parameterizing and adjusting software) and handheld testo 400/650

Voltage supply
- 4-wire (separate signal and supply lines): 20 to 30 V AC/DC, 300 mA power consumption

Maximum load
- 4-wire: 500 Ω (power output)

Maximal load
- 4-wire: 10 kΩ (voltage output)

Analog output
- 0 to 1 V ± 1.5 mV (4-wire) or
- 0 to 5 V ± 7.5 mV (4-wire) or
- 0 to 10 V ± 15 mV (4-wire) or
- 0 to 20 mA ± 0.03 mA (4-wire) or
4 Transmitter

- 4 to 20 mA ± 0.03 mA (4-wire)

**Resolution of analog output**
- 12 bit

**Relay**
- 4 relays, 250 V AC/DC, 3 A (optional)

**Display**
- 2-line LCD with plain text line (optional)

**Operating temperature**
- -5 to 50 °C/23 to 122 °F

**Storage temperature**
- -20 to 60 °C/-4 to +140 °F

**Process temperature**
- -20 to 65 °C/-4 to 149 °F

**Oper. humidity**
- 0 to 90 % RH

**Housing, weight**
- Metal: 1.960 kg
- Ethernet module: 0.610 kg

**Protection class**
- IP 65 only if the transmitter is wired properly (closed cable entries), Ethernet connector, Harting PushPull connector and humidity probe are inserted and/or sealing plugs are inserted.

**Directives, standards and tests**
- DIN 14644-4
- EN 61000-6-2 interference immunity
- EN 61000-6-3 interference emission
- EN 61326-1+A1+A2
4 Transmitter

**Ethernet module**
- Interface:
  - 1 x mini-DIN
  - 1 x RJ45 (Ethernet 10 BaseT/100 BaseTX)
- LED:
  2 x green

**Warranty**
- Duration: 2 years
- Warranty conditions: see website www.testo.com/warranty

</table>

### 4.2.3. Display and keypad

The display option allows operation of the testo 6381 transmitter via the display and four keys.

The LCD display consists of two 7-segment lines for displaying readings and units and of an information line (for status messages, for example).

The brightness and contrast of the display and the background lighting (permanent or off) can be changed via the user menu or the P2A software.

### 4.2.4. Service interface

The parameterizing socket (mini-DIN) is located behind the service flap as an interface to the P2A software or Testo handheld instrument (testo 400/testo 650).

### 4.2.5. Relay board (option)

This has a floating switch capacity of 250 V AC/3 A. The switching limits and hysteresis as well as the function as relay for the collective alarm can be set via the display or the P2A software.

Further features include:

- Function of changeover contacts (NC/NO contacts) freely selectable
- 12 terminals for a total of 4 relays.

If no relays are available, settings for monitoring limit values or alarms can still be controlled via the display. The alarm status will be shown on the display.

Only have the transmitter wired and connected by authorized personnel with the voltage disconnected.
4.2.6. **Analog outputs**

As analog outputs, the testo 6381 has either

- 1 or optionally 3 current outputs of 0 to 20 mA (4-wire)/4 to 20 mA (4-wire) or
- 1 or optionally 3 voltage outputs of 0 to 1 V/0 to 5 V/0 to 10 V (4-wire).

The transmitter can be ordered with three analog outputs as an option.

The optional three channels are galvanically isolated.

4.2.7. **Parameters**

The following parameters are displayed

- Differential pressure in Pa, hPa, kPa, mbar, bar, mmH₂O, kg/cm², PSI, inch HG, inch H₂O
- Volumetric flow rate\(^3\) in m³/h, l/min, Nm³/h, NL/min
- Flow\(^4\) in m/s, ft/min
- Relative humidity in % RH (technical)
- Relative humidity in % WMO* (calculation according to the WMO standard)
- Degree of humidity in g/kg and gr/lb
- Absolute humidity in g/m³ and gr/ft³
- Water content in ppm (vol) and % vol
- Psychrometer temperature in °C\(_{\text{tw}}\) and °F\(_{\text{tw}}\)
- Enthalpy in kJ/kg and BTU/lb
- Water vapour partial pressure in hPa and H₂O
- Dewpoint temperature in °C\(_{\text{td}}\) and °F\(_{\text{td}}\)
- Standardized dewpoint in °C\(_{\text{tdA}}\), standardized at atmospheric pressure (1013 hPa); precondition: Absolute process pressure.

* It is possible that condensation appears as of a displayed humidity starting from 70 % and is shown on the display. This unit is used in meteorology, amongst others. When calculating

\(^3\) Calculated
\(^4\) To prevent fluctuating flow rate values at the zero point (depressurized), the flow rate values are only calculated as of differential pressures > 0.2 Pa or > 0.1 % of the respective measuring range (whichever is the greater). With smaller differential pressures, the flow rate value remains at 0.00 m/s.
Calculating the relative humidity, the Magnus coefficient is used with undercooled water in accordance with WMO.

Calculated humidity variables correspond to the medium of air. With other gases/gas compositions, deviations may occur, e.g. with the enthalpy.

- Dewpoint of H₂O₂ mixture in °Cₘₚ and °Fₘₚ
- Temperature °C and °F

### 4.2.8. Scaling

There are three types of min./max. values:

1. The measuring range: The maximum sensor performance is in this range. Values outside of the measuring range are displayed via messages, for example. Measuring range, see table (below).

2. Standard scaling: The output signals are assigned to this measuring range as standard:
   - during delivery if no entries are made in the order code
   - after replacing the unit, the measuring range recorded in the instrument is applied as standard.

3. The transmitter even retains its scaling with the voltage disconnected.

Measuring range, see table (below).

The maximum settings for the manual scaling:

- The maximum limits can be calculated as follows:
  
  \[ X = \text{difference between MIN. and MAX. value of the standard scaling} \]
  
  
  \[ (\text{Max. value of standard}) + (50 \% \text{ of } X) \]
  
  \[ (\text{Min. value of standard}) - (50 \% \text{ of } X) \]
  
  - It is thus possible to scale beyond the measuring range, e.g. for the adjustment of the scaling limits to standard values of a PLC.

With the alarm definition, however, the physical measuring range limits are decisive.

### 4.2.9. Alarm handling

For upper and lower alarm limits, individual alarms as well as collective alarms can be specified. If the collective alarm function is activated, an alarm is triggered as soon as the alarm limit of an alarm is exceeded, if this alarm is assigned to the collective alarm.

The testo 6381 monitors limit values with the help of relays. If a reading is outside the limit values, a relay to be specified by the user is switched.

If the reading reverts to more than a specified hysteresis below or above the limit value, the alarm is cancelled.

In addition, information about the occurrence of error/status messages can be provided by means of a collective alarm relay, see Status, warning and error messages, page 79

---

*If multiple alarm messages are activated at the same time, the last alarm is shown. If the alarm is cancelled again, the previous messages are no longer shown.*
4.3. Commissioning

4.3.1. Inserting Ethernet module (order no. 0554 6656)

The Ethernet module can be ordered retroactively as an accessory. It can easily be installed in the testo 6381 transmitter.

✓ The probe connector must be disconnected.

1. Loosen screw connection (1) of service flap and open the flap.
2. Loosen and remove housing screws (2).
3. Remove upper part of housing (3) and place on a clean surface.
4. Place Ethernet module (A) on lower part of instrument (4).

First set the desired operating mode via the DIP switch (see Setting the Ethernet module, page 34) before fixing the instrument in place.

5. Set on upper part of instrument (5) and fix in place using the housing screws (6) provided in the accessories.
4.3.2. **Assembling the instrument**

4.3.2.1. **Wall mounting** (for testo 6611, 6613, 6614, 6615, 6617 probes)

**Attaching rear panel bracket**

1. Remove locking screw (see item (4) of drawing below) and detach rear panel bracket from plastic bracket (see item (2) of drawing below).
2. Hold rear panel bracket in assembly position and mark the three drill holes.
3. Drill three holes (Ø 5 mm) and insert dowels where necessary.
4. Screw on rear panel bracket.
   Remember that the clamping brackets (1) must face the wall.

**Fastening instrument to rear panel bracket**

1. Slide plastic bracket (2) on the back of instrument onto rear panel bracket until it engages (see arrows).
2. Insert screw (4) through hole (3) and screw into rear panel bracket.
3. Insert probe connector (5) into socket until it engages.

4.3.2.2. **Duct mounting (for testo 6612 probes)**

1. Hold wall/duct bracket (order no. 0554 6651) (6) against duct wall (8) and mark drill holes for wall/duct bracket and probe shaft.
2. Drill a hole (Ø 12.5 mm) in the duct wall to feed through the probe shaft.
3. Fasten wall/duct bracket (6) to duct wall with screws (5).
4. Push probe shaft (9) with filter (10) through the middle hole of the mounting bracket.

The wall/duct bracket (6) has an O-ring (7) to seal it against the duct. Feed the probe shaft (9) carefully through the wall/duct bracket so that the O-ring is not damaged.
5. Fix the correct position of the probe shaft (9) with screw (11) and mark (insert probe shaft as far as possible).

6. Slide plastic bracket (2) on the back of the transmitter onto bracket (3, 4) until it engages.

Take the weight of the transmitter into account. Ensure that the brackets (4, 6) are fastened securely.

7. Insert screw (1) through the hole on the top of the instrument and screw into bracket (3).

8. Insert probe connector (12) into socket until it engages.

4.3.3. Connecting the instrument

Opening the instrument

1. Loosen screw connection (1) of service flap and open the flap.
2. Loosen and remove housing screws (2).

* The Ethernet module (A) is already detached from the upper and lower parts of the housing by removing the housing screws (2).

3. Remove upper part of housing (3) and place on a clean surface.

4. Remove Ethernet module (A) from lower part of housing (4) and also place on a clean surface.
4.3.3.1. Overview of terminals

1 Lower part of housing
2 Relay board (option)
3 Relay terminals
4 Insulating trough for relay board
5 Terminal strip for voltage supply and analog outputs
6 Terminal board
7 Earthing terminal (internal)
8 M 16 x 1.5 screw connection*
9 Earthing terminal (external)
10 M 20 x 1.5 screw connection*
11 Eyelet for measuring point panel

---

**WARNING**

**Electrical voltage**

**Danger of injury!**

> De-energize the mains connection before connecting the transmitter.

Only have the transmitter wired and connected by authorized personnel with the voltage disconnected.
The following description of the terminals refer to this overview and its numbering.

### 4.3.3.2. Connecting voltage supply and analog outputs

![Terminal strip diagram](image)

1. Feed cable with voltage supply and analog signal lines through opened M 16 x 1.5 screw connection (item (8) in the overview of terminals, page 27).

2. Strip the cable ends, clamp wire end ferrules on and screw down onto voltage terminals.

3. Close M 16 x 1.5 screw connection (item (8) in the overview of terminals, page 27).

**Wiring diagram for 4-wire system (0 to 20 mA/4 to 20 mA/0 to 1 V/0 to 5 V/0 to 10 V)**

![Wiring diagram](image)

- **1** 1 or 3 channels, 0 to 20 mA/4 to 20 mA max. load per 500 Ω 0 to 1 V/0 to 5 V/0 to 10 V

**Requirement for the connecting cable of the supply:**
- Insulated with cross-section of at least 0.25 mm², maximum 2.7 mm² without wire end sleeves.
- The supply line must be secured against exceeding 0.5 A.
- An OFF switch must be installed in an easily accessible position close by and be marked as such.
1. Feed connection cables of the one, or optionally three, channels through opened M 16 x 1.5 screw connection (item (8) in the overview of terminals, page 27).

2. Strip the cable ends, clamp wire end ferrules on and screw to channel terminals as shown in diagram.

3. Close M 16 x 1.5 screw connection (item (8) in the overview of terminals, page 27).

4.3.3.3. Connecting the relay outputs

Only have the transmitter wired and connected by authorized personnel with the voltage disconnected.

<table>
<thead>
<tr>
<th>Relay terminal strip, item (3) of overview of terminals</th>
</tr>
</thead>
<tbody>
<tr>
<td>R1</td>
</tr>
<tr>
<td>NC/C/NO</td>
</tr>
</tbody>
</table>

There is the option of twelve terminals for a total of four relays. The designations NC/C/NO (normally closed contact/root or pin/normally open contact) are etched on the surface of the board.

Using PG screw connection

1. Feed connection cables for the relays through opened M 20 x 1.5 screw connection (item (10) of overview of terminals).

2. Strip cable ends and clamp on wire end ferrules.

3. Connect relays according to chosen function (NC/NO) (see diagrams below; relay 1 is shown as an example of a connection).

Using plug-in connections (optional)

Only insert or disconnect the plug-in connection when the voltage is disconnected.

4. Clean the connector of the probe line and the coupling of any foreign matter.

Do not disconnect the connector of the probe line from the instrument for extended periods to protect against contamination.
Connection note

- For the connection, a double-insulated mains cable (sheathed cable) with a cross-section of at least 1.5 mm² must be used.
- Cable connection (2) may not be routed in a loop within the tray (1).
- It is recommended that you always tie 3 cores to one another using a cable tie (3).
- The insulation of the cable must be fed at least 5 mm (4) into the tray.
Use of relay as NC contact (NC = normally closed)

1 Alarm/status light (example of installation)
2 250 V AC/DC, 3 A

The busy light (alarm/status light) is permanently on until the relay opens or the circuit is interrupted. This circuit can therefore be used to monitor the functionality of the alarm circuit, as a cable break, for instance, is indicated by the busy light going off.

Use of relay as NO contact (NO = normally open)

1 Alarm/status light (example of installation)
2 250 V AC/DC, 3 A
The busy light (alarm/status light) only comes on when the relay is switched (closed). Monitoring the functionality of the alarm circuit is therefore not possible with this switching operation.

5. Close M 20 x 1.5 screw connection (item (10) in overview of terminals).

4.3.3.4. Plug-in connection option

As an option, the PG screw connections of the signal and supply lines can be replaced with plug-in connections that are installed at the housing, see item 1 and 2. The relay cabling occurs via standard cable entries and PG screw connections, see item 3 and 4.

### Plug-in connections for power supply and channels

</tr>
</tbody>
</table>

4.3.3.5. Creating the PE/earthing terminal

As the testo 6381 has a metal housing, we recommend that the instrument be earthed. This can be done using the earthing terminal within the instrument (1) or the earthing terminal outside of the instrument (2).

ℹ️ Only use the external earthing terminal in dry interiors.

Using the earthing terminal within the instrument

1. Guide shielded cable (5) through the cable coupling (x) and fit cable lug (8). Fix this to the side of the instrument (6) using M 5 screw (3), washer (4) and snap ring (7) on the internal earthing terminal (1).
2. Place the other cable end on an appropriate functional earth, e.g. an earthing bar.

**Using an earthing terminal outside of the instrument**

1. Use PE line (yellow-green) (5) with cable lug (8). Fix this using M 5 screw (3), washer (4) and snap ring (7) on the external earthing terminal (2).
2. Place the other cable end on an appropriate functional earth, e.g. an earthing bar.

### 4.3.3.6. Setting the Ethernet module

Using a DIP switch the Ethernet module can be switched between two main functions:

- **Saveris subscriber function** (DIP switch no. 1 = on, DIP switch no. 2 = on), testo 6381 is used as a testo Saveris component.
- **XML server function** (DIP switch no. 1 = off, DIP switch no. 2 = on), integration of the testo 6381 into the customer’s Ethernet system.

<i> In the condition on delivery, the switch position is set to on (Saveris mode) with the testo 6381 with Ethernet module.</i>

✓ The testo 6381 must be separated from the Ethernet network.

1. Open transmitter (see Opening the instrument, page 25).
2. Set DIP switch no. 1 (1) at Ethernet module. In the picture: DIP switch no. 1 off, DIP switch no. 2 on\(^5\)
3. Set Ethernet module on lower part of housing (see arrow).

4. For the configuration of the Ethernet module, see following chapter.
5. If you do not wish to perform a configuration, close the transmitter.

\(^5\) DIP switch no. 2 non-functional
4.3.3.7. Closing the instrument

1. Place Ethernet module (A) on lower part of instrument (1).
2. Set on upper part of instrument (2) and fix in place using housing screws (3).
3. Close the service flap and tighten screws (4).
4. Connect Ethernet network cable to the transmitter via the Ethernet jack.

4.3.4. Ethernet communication

4.3.4.1. Types of operation
In general, the Ethernet module performs two functions:
• a corresponding testo 6381 becomes a Saveris subscriber
• a corresponding testo 6381 can be integrated into any Ethernet systems

4.3.4.2. Mains connection
> Connect the network cable to the transmitter.

The network cable must not be connected directly to the telephone network (ISDN).
In order to ensure the IP protection class, an RJ 2.5 Harting PushPull connector must be used.
4.3.4.3. **LED status displays**

<table>
<thead>
<tr>
<th>Characteristic</th>
<th>LED 1</th>

<td>LAN connection present</td>
</tr>
<tr>
<td>Status: flashes</td>
<td></td>
<td>Data transfer</td>
</tr>
</tbody>
</table>

4.3.4.4. **testo 6381 as Saveris subscriber**

**Setting the IP address**

✓ Upper part of housing must be removed.

✓ Network cable must be connected to the Saveris base and to the Ethernet module.

✓ Service plug must be inserted.

The IP address of the transmitter can either be set via the P2A software (transmitter accessories) or via the configuration menu of testo Saveris™ (testo Saveris™ Ethernet Wizard).

1. Set the IP address with the P2A software (see Using the software, page 131) or with the testo Saveris™ Ethernet Wizard (see instruction manual).
2. Disconnect service plug.
3. Disconnect the Ethernet module from the voltage supply.
4. Close instrument (see Closing the instrument, page 36).

**Using Saveris**

>- Start Saveris software (see instruction manual Measurement data monitoring with testo Saveris)

> Ensure that the Saveris software is not already open, for example in multi-user operation under Windows® Vista. If multiple clients are installed in a network, make sure that no simultaneous changes are made to the system configuration by the clients during simultaneous operation of the clients.
1. [Start] | All Programs | Testo |
   • Select Saveris Professional Client (full version). The entry is available if Saveris Professional Client is installed
   • Select Saveris Viewer (limited functionality). The entry is available if Saveris Viewer is installed
   - The Testo Saveris software program window is opened with the Select project dialogue.

   If the software will not start, check whether the testo tdassvcs service is started in the service management of the operating system and restart it, if needed.

2. Select the
   • Only active projects option if the data from a running project should be opened
   • All projects option if the data from a completed project should be opened.

3. Select the project that is to be opened in the tree structure.
4. Confirm with [OK].
   - The Testo Saveris software program window is shown with the selected data record in the foreground.

4.3.4.5. Integration into customer's Ethernet system

Precondition

The user should be familiar with the structure of an XML document. Furthermore, enough knowledge should be available that this type of document can be downloaded and decoded via an Internet connection with the aid of a programming/script language.
Interface

The communication takes place according to the client/server principle, whereby the Ethernet module takes on the role of the server:

The XML interface will be approached via a URL. The URL consists of the IP address of the Ethernet module, the path for the XML document and, depending on the URL, with a clearly defined parameter. If a parameter is missing or an incorrect value is transferred, the Ethernet module sends back a simple error message.

Example:

IP address = 254.169.100.100
URL for serialnumber.xml:
http://254.169.100.100/data/getserialnumber
If a parameter is required, a "?" is always in the first place after the URL, then the parameter is transferred to the common query string form (name=value).

Example:

IP address = 254.169.100.100
URL for / identification.xml:
http://254.169.100.100/data/getidentification?param=0 (compare table xml codes)

After calling up the compound URL, if everything was correct, an XML document is returned. With faulty parameters a simple HTML answer comes that points out the reason that an XML answer could not be given.

If an XML document is to be loaded on the server, access is provided by means of a POST request

Example of an upload via the program wget:

IP address = 254.169.100.100
URL for / usersettings.xml:

<table>
<thead>
<tr>
<th>Path details of the folder in which the wget program is located</th>
<th>Command</th>
<th>Path details of the folder in which the usersettings XML file is located</th>
<th>IP address of the transmitter and required URL (see table on the next page)</th>
</tr>
</thead>
<tbody>
<tr>
<td>H:/wget/wget-complete-stable</td>
<td>/wget --post-file=</td>
<td>C:/usersettings.xml</td>
<td>254.169.100.100/config/setusersettings</td>
</tr>
</tbody>
</table>
The Ethernet module supports reading out of:

- Readings
- Instrument type (testo 6381)
- Firmware date and version (testo 6381)
- Status and status messages (testo 6381)
- Alarm messages (testo 6381)
- Service hour counter (testo 6381 and probe)

as well as the reading and writing of:

- Adjustment data (testo 6381)
- Configuration data of analog outputs (testo 6381)
- Configuration data of relays (testo 6381)
- User settings (testo 6381)

```

More information can be found in the download area at www.testo.com.

### 4.3.4.6. Adjusting the instrument

The testo adjusting concept allows the entire signal chain from the sensor signal (probe) and the digital signal (within the transmitter) through to the analog signal (transmitter output signal) to be adjusted (see diagram).

<table>
<thead>
<tr>
<th>1-point adjustment</th>
<th>2-point adjustment</th>

- P2A software
### 4.3.4.7. Overview: Adjustment keys and test contacts

1. Status LED
2. Contact ch. 1+
3. Contact ch. 1-
4. Adjust key 11.3 %
5. Service interface
6. Adjust key 75.3 %
7. Contact ch. 2+
8. Contact ch. 2-
4.3.4.8. **1-point adjustment (offset - humidity/temperature)**

In the 1-point adjustment, the reading at the working point is raised to the reference value so that there is no longer any deviation in the working point. The reference condition can be measured using a precise handheld instrument (e.g. testo 400/650 with precision humidity probe) or be created in an air conditioning cabinet.

![Diagram showing deviation, working point, and working range.](image)

The advantage of the 1-point adjustment is the good measuring result in the working range. But the further away the measurement is from the working point, the greater the deviation can become. The 1-point adjustment should therefore only be used for a relatively narrow measuring range (working range), e.g. clean room applications, air conditioning applications for storage and similar.

The 1-point adjustment can be performed

- via the user menu (see Editing Main Menu Adjust, page 76) or
- via the P2A software (see volume 2, 1-point adjustment, page 152) or
- directly by means of a Testo handheld instrument (testo 400/650) (see description of how to proceed below).

Please note that the 1-point adjustment is generally performed on the basis of the % RH and °C/°F parameters.
Adjusting testo 6381 using testo handheld instrument

✓ The service flap is open, a testo 400/650 handheld instrument with a precision humidity probe is ready.

1. Connect testo handheld instrument 400/650 (1) with connected humidity reference probe (3) (order no. reference set 0699 3656/20) to the service interface (5) of the testo 6381 via the adjustment adapter (2) (connected to probe socket 1 of the handheld instrument).

2. Expose the humidity probe (4) of the testo 6381 and the reference probe (3) to the same reference conditions (e.g. in the humidity generator) and allow climatic conditions to equalize.

3. Switch on the testo 400/650. The two-part display of the handheld instrument will show the values of the transmitter on the left, and the values of the reference probe on the right. The humidity and temperature values are adjusted to the reference probe using the **Probe > Probe Adjustment** menu item on the testo 400/650. The 1-point adjustment is performed for both the humidity and the temperature.
4. Disconnect the adjustment adapter (2) from the service interface (5).

5. Close the service flap.

4.3.4.9. 2-point adjustment (humidity/temperature)

With the 2-point adjustment, the parameter is adjusted to the reference value at the two standard adjustment points 11.3 % RH and 75.3 % RH. The reference conditions are created either by using testo adjustment salt pots (order no. 0554 0660) or in the humidity generator.

In the 2-point adjustment, the deviations between the reading and the nominal value are minimized across the entire measuring range. The 2-point adjustment is therefore recommended for large working ranges.

The 2-point adjustment can be performed

- via P2A software (see volume 2, 2-point adjustment, page 154)
- or

- using the adjustment keys under the service flap, see description of how to proceed below.

A previous 1-point adjustment is undone during a 2-point adjustment.

Adjustment with the standard testo adjustment salt pots is not suitable for the testo 6614 (heated for high-humidity applications) and testo 6615 (trace humidity) probes. The reference conditions should be generated in a humidity generator to adjust these probes. In addition, these probes can also be adjusted at a third adjustment point by Testo Service.

- testo 6614: third adjustment point at 90 % RH
- testo 6615: third adjustment point at -40 °Ctd/-40 °Ftd
Adjusting testo 6381 using adjustment keys

11.3 % RH ⇒ 75.3 % RH  
1.5 h 1.5 h  
(salt pots)  

or  
11.3 % RH ⇒ 75.3 %  
1.5 h 1.5 h  
(humidity generator)

✓ The service flap of the testo 6381 is open:

1. Expose the humidity probe of the testo 6381 to the reference condition of 11.3 % RH for at least 1.5 hours at 25 °C.

2. After this equalization period, press the 11.3 % adjustment key (4) for at least 10 seconds with something like a ball-point pen that is not too sharp.

- The LED (1) flashes when the adjustment process begins. After about 10 seconds, the 2-point adjustment 11.3 % status message appears on the display.

- Completion of the adjustment is signalled by the LED (1) coming on permanently and the Probe reset status message is shown.

3. Carry out the adjustment analogously for the reference condition 75.3 % RH. Press the 75.3 % RH adjustment key (6) to do this.

4. Close the service flap.
4.3.4.10. **Analog output adjustment**

The purpose of adjusting the analog outputs is to adjust the signal chain from the digital signal (within the transmitter) to the analog outputs. The signal type that was appointed for the transmitter is adjusted respectively for each channel (e.g. 4 to 20 mA or 0 to 1 V, etc.).

- Status LED
- Contact ch. 1+
- Contact ch. 1-
- Adjust key 11.3 %
- Service interface
- Adjust key 75.3 %
- Contact ch. 2+
- Contact ch. 2-

**Adjusting analog outputs 1 and 2 (optional)**

- With testo 6381 with current output: Load of max. 500 Ω is connected to channel that is to be adjusted (see Plug-in connections for power supply and channels, page 32)

- A precise multimeter (minimum requirement: resolution 6.5 digits, at least 5-times more accurate than the 6381) is available.

**Note:** If only a simple multimeter is available, the analog outputs must not be adjusted.

- The service flap is open.

1. Connect the inputs of the multimeter with the contacts (2) and (3) for channel 1 or with contacts (7) and (8) for channel 2.
2. Transfer the reference analog value measured with the multimeter into the P2A software (see volume 2, Adjusting the analog output, page 156) or enter it via the user menu (see Performing analog adjustment, page 77).

3. Disconnect connections between the multimeter and the contacts of the testo 6381 and close the service flap.

**Adjusting analog output 3 (optional)**

If the optional third analog output is to be adjusted, a cable connection to measure the analog value must be installed. Do this by proceeding as follows:

1. Open transmitter (see Opening the instrument, page 25).

2. Connect measuring cable to the terminals of the third analog output and guide through the cable coupling and out of the transmitter.

3. Reassemble upper part of transmitter (see Closing the instrument, page 36).

4. Connect cable ends to the inputs of the multimeter.

5. Transfer the reference analog value measured with the multimeter into the P2A software (see volume 2, Adjusting the analog output, page 156) or enter it via the user menu (see Performing analog adjustment, page 77).

6. Remove the upper part of the transmitter, detach the cable connections for the adjustment of the 3rd analog output and reassemble the transmitter.

**4.3.4.11. n-point adjustment (pressure)**

With an n-point adjustment, the parameters at the 3-6 measurement points are adjusted to the reference value. The reference conditions are obtained by using a precise pressure sensor that should be 5-times more accurate than the transmitter.

1. Positive pressure connection

2. Negative pressure connection

3. Pressure sensor
The number of measuring points is set to 3 by the factory and can only be changed using the P2A software (see n-point adjustment page 155).

The n-point adjustment must always be carried out to its full extent and in good time at all selected measurement points.

✓ A precise pressure sensor (5-times more accurate than the transmitter, e.g. DPC precision pressure sensor from testo industrial services) is available.

1. Connect the positive output of the pressure sensor (3) to the positive pressure connection of the transmitter (1) and the negative output of the pressure sensor (3) to the negative pressure connection of the transmitter (2).
2. Transfer the reference pressure value created with the pressure sensor into the P2A software (see volume 2, n-point adjustment, page 155) or enter it via the user menu (see Performing the pressure adjustment, page 78).
3. Repeat step 2 for all of the measuring points.
4. Disconnect connections between the pressure sensor and the pressure connections of the testo 6381.

4.3.4.12. High-humidity adjustment for testo 6614
With the testo 6614, the rear of the Testo humidity sensor is heated, creating a microclimate around the sensor (within the filter) that is constantly 5 K warmer than the actual process conditions. As can be seen in the Mollier diagram, this reduces the relative humidity at the sensor from around 100 % RH to a lower value, e.g. 73 % RH. In this range, the reaction time of the sensor is noticeably shorter than in the condensation range and the risk of the sensor corroding is also reduced. Using the separate temperature probe, the testo 6381 transmitter compensates the microclimate conditions and displays the process readings.

The reference conditions (11.3 % RH and 75.3 % RH) for the 2-point adjustment of the testo 6614 should be generated in a humidity generator, as humidity adjustment sets cannot be used due to the heat generated. The adjustment can also be carried out at a third adjustment point (90 % RH) by Testo Service so that optimum accuracy is also achieved in the high humidity ranges.

4.3.4.13. **Self adjustment of testo 6615 trace humidity probe**

Conventional trace humidity probes show a steep rise in measuring uncertainty at low humidities. In the testo 6615 trace humidity probe, these measuring uncertainties are corrected by means of an automatic self-adjustment process. This means that extremely accurate measuring results are also attained to -60 °Ctd.

To this end, a temperature sensor is fitted on the back of the testo 6615 which is used as a heater. A humidity and temperature value pair is taken in both the unheated and heated state. The deviation of the probe obtained from these pairs of values is automatically corrected.
The heating time and storing of cycles can be edited in the P2A software; for example, they can be deactivated by setting the two parameters to "0".

- Deactivating the adjustment function of the testo 6615 will reduce measuring accuracy and should therefore be restricted to the shortest possible length of time.

- During the heating phase, the relay and analog outputs, the display value and output value are "frozen", see diagram above. **Self-adjustment active** is shown in the display until it has finished. The factory setting for self-adjustment time (incl. heating time, calculation time, cooling time) requires 30 minutes daily.

- In the factory setting, a **third adjustment point** (-40 °Ctd) is approached for the testo 6615 in addition to the 2-point adjustment. This special adjustment can be performed again by your Testo Service team if necessary.
4.4. **Operation**

4.4.1. **Relationship between user menu and mini-DIN socket is active**

The testo 6381 can be parameterized using either the user menu or the P2A software (see volume 2, Parameterizing, adjusting and analyzing software (P2A software) page 128).

The testo 6381 transmitter can only be operated via the display and keypad if the display option is available. If the testo 6381 is connected to the P2A software, the user menu is blocked for the duration of the communication. The message Service plug is shown in the display of the testo 6381. As soon as the P2A software is disconnected, the user menu is accessible again.

4.4.2. **Key cover**

To prevent unauthorized operation of the keys, the standard key frame can be replaced with a key cover.

If the key cover has been assembled, the service flap must be opened for operation.
Attaching the key cover

✓ The service flap is opened, see Opening the instrument, page 25.
1. Unscrew screws (3) and remove key frame (2).
2. Insert key cover (1) into service flap and tighten screws (3).
3. Close and screw down the service flap.

4.4.3. Password protection

The user menu can be protected with a four-digit numerical code (see Editing Main Menu Settings, page 69) so that access to the user menu is denied to unauthorized persons not familiar with this numerical code.

If the password protection is not to be used, the numerical code "0000" must be entered. This is also the status upon delivery.

4.4.4. Structure of user menu

At the main menu level, the user menu comprises the following:
• Main Menu Channel 1
• Main menu of channel 2 (if this option is available)
• Main menu of channel 3 (if this option is available)
• Main Menu Alarm
• Main Menu Settings
• Main Menu Analysis
• Main Menu Messages
• Main Menu Ident
• Main Menu Adjust
• Main Menu Reset

![Transmitter Display]

1 Channel 1 display
2 Channel 2 display
3 Channel 3 display or for messages

Four keys enable the user to navigate/scroll through the menus and enter/amend values and settings:

<table>

4.4.6. The individual main menus

4.4.6.1. Editing main menu of channel 1

An overview is given in Overview of the testo 6381 user menu, page 63).

You can perform basic settings for channel 1.

1. In the Measuring Mode press SET, select Main Menu Channel 1 with ► or ▲ and confirm selection with SET.

   One of the following parameters can now be selected using ► or ▲, after which the selection must be confirmed with SET:
   
   • Channel 1 Unit
     The parameter for this channel is selected.
     Edit/select parameter with ► or ▲, confirm with SET or abort entry with ESC.
   
   • Scale minimum for channel 1:
     The lower scale limit is edited; Unit as selected above.
     Editing the value: Scroll one digit to the right using ► and increase value of digit by 1 using ▲. Confirm with SET or abort entry with ESC.
   
   • Scale maximum for channel 1
     The upper scale limit is edited; Unit as selected above.
     Editing the value: Scroll one digit to the right using ► and increase value of digit by 1 using ▲. Confirm with SET or abort entry with ESC.
   
   • Signal delay (“Attenuation”) for channel 1
     The analog signal can be delayed (“Attenuation”); a time constant is selected for this (1 = no delay; 15 = longest delay).
     Edit/select parameter with ► or ▲, confirm with SET or abort entry with ESC.

2. Continue to the main menu with ► or ▲ or return to Measuring Mode with ESC.

4.4.6.2. Editing Main Menu Channel 2 (if this option is available)

See channel 1.
4.4.6.3. Editing Main Menu Channel 3 (if this option is available)

See channel 1.

4.4.6.4. Editing Main Menu Alarm

With the alarm, the relays, available as options, are programmed. In addition, the alarm statuses are shown on the display (top right) (even without relays).

You can choose whether the alarm is to be used to monitor limit values or as a collective alarm. If an alarm is to be used to monitor limit values, you can choose between monitoring the minimum or maximum value and set a limit value and hysteresis for each alarm.

In addition, every alarm can be linked to a clearly visible visual alarm (display background lighting flashes).

An alarm delay between 0 and 240 seconds can still be assigned to every alarm used for limit value monitoring so that both the corresponding relay effect and the visual alarm are delayed. If the alarm status goes out within the set alarm delay time, neither the visual alarm nor a relay connection is triggered.

With an alarm status present, the visual alarm and all relay outputs can be reset by means of acknowledgement. The triggering of a new alarm cannot be enabled until after the alarm status goes out.

1. In the Measuring Mode press SET, select Main Menu Alarm with ► or ▲ and confirm selection with SET.
   - Four alarms can be parameterized.
2. Select Alarm x with ► or ▲ and confirm selection with SET.

Using alarm to monitor limit values

NO contact

<table>
<thead>
<tr>

</tbody>
</table>
3. Select **Channel x** (e.g. "Channel 1") with ▶ or ◀ and confirm selection with **SET**.

4. Select **Max control** or **Min control** with ▶ or ◀ (see graphic).

5. Press **SET** and edit **Limit value** as well as **Hysteresis**: Scroll one digit to the right using ▶ and increase value of digit by 1 using ◀. Confirm with **SET** or abort entry with **ESC**.

6. Select **Visual alarm** with ▶ or ◀. Select **YES** or **NO** with ▶ or ◀. Confirm with **SET** or abort entry with **ESC**.

7. Press **SET** and edit **Alarm delay**: Scroll one digit to the right using ▶ and increase value of digit by 1 using ◀ (0 to 240 seconds possible). Confirm with **SET** or abort entry with **ESC**.

8. Return to **Channel x** with **ESC**.

9. Return to **Alarm x** with **ESC**.

10. Change to the other relays using ▶ or ◀ and perform settings in the same way.

**Using alarm as collective alarm or not using it at all**

If an alarm is assigned to the collective alarm, the relay is switched and a visual alarm can be issued via the display as soon as (at least) one of the warning or error messages of the testo 6381 transmitter (or the connected testo 6610 probe) becomes active.

- The messages affecting the collective alarm can only be selected in the P2A software, see volume 2, Using the software, page 131

**✓** Alarm is selected (see previous steps 1 and 2).

1. Use ▶ or ◀ to determine whether **Alarm x** should be used as a **Collective alarm** or **not used**. Confirm selection with **SET**.

2. If collective alarm is selected: Select **Visual alarm** with ▶ or ◀. Select **YES** or **NO** with ▶ or ◀. Confirm with **SET** and return to **Alarm x**.
3. Change to another alarm using ▶ or ▲ and perform settings in the same way.
4. Return to Main Menu Alarm with ESC.
5. Continue to Main Menu Settings with ▶ or ▲ or return to Measuring Mode with ESC.

4.4.6.5. Editing Main Menu Settings

You can edit instrument settings and other settings.

> In Measuring Mode, press SET, select Main Menu Settings using ▶ or ▲ and confirm selection with SET.

You can edit settings for:

- Display
- Language
- Code
- Units
  - Absolute pressure
  - Area
  - Temperature
- Standard data
  - Absolute pressure
  - Temperature
- Pressure process data
  - Absolute pressure
  - Humidity
  - Temperature
  - Cross-section
  - Pitot tube factor
  - Correction factor
- Humidity process data
  - H2O2 percentage by weight
  - Humidity process pressure
Editing display settings
You can set the brightness and contrast of the display.
1. Select Display Settings with ▶ or ▲ and confirm selection with SET.
2. Select Backlight or Contrast with ▶ or ▲ and confirm selection with SET.

One of the following parameters can now be selected using ▶ or ▲, after which the selection must be confirmed with SET:

- **Backlight**
  The display illumination is changed.
  Edit/select parameter with ▶ or ▲, confirm with SET or cancel entry with ESC (the effect of the change in parameter can be seen during input).

- **Contrast**
  The brightness difference between the display background and the displayed values is changed.
  Edit/select parameter with ▶ or ▲, confirm with SET or cancel entry with ESC (the effect of the change in parameter can be seen during input).

- **Backlight 24h on**
  Select On or Off using ▶ or ▲ and confirm with SET.
  Off: The display light switches off automatically if no button was pressed for 10 seconds.
  On: The display light is activated

3. Return to Display Settings with ESC and use ▶ or ▲ to continue to Language.

Selecting language
You can select the language for the plain text line in the display.
> Press SET, select required language with ▶ or ▲, confirm selection with SET and return to language.

Only choose a language that you can understand well.
Editing code settings

You can set the access code (password).

If a code other than "0000" (factory setting) is set, the transmitter can only be operated once this code has been entered via the menu.

1. Select Code with ▶ or ▲ and confirm selection with SET.
2. Scroll one digit to the right using ▶ and increase value of digit by 1 using ▲. Confirm with SET or abort entry with ESC.
3. Return to Code with ESC and use ▶ or ▲ to continue to Change parameters.

Select unit (Change unit)

This setting affects the displayed unit of all readings.

1. Select Change parameters with ▶ or ▲, confirm selection with SET or cancel with ESC.
2. Select Change unit with ▶ or ▲, confirm selection with SET or cancel with ESC.
3. Select the required variable (absolute pressure/temperature) with ▶ or ▲, confirm selection with SET or cancel with ESC.
4. Select the required unit with ▶ or ▲, confirm selection with SET or cancel with ESC.
5. Return to Change unit with ESC and continue to Standard data with ▶ or ▲.

Editing standard data

Setting individual values for the standard data to calculate the volumetric flow rate.

1. Select Standard data with ▶ or ▲, confirm selection with SET or cancel with ESC.
2. Select the required variable (absolute pressure/temperature) with ▶ or ▲, confirm selection with SET or cancel with ESC.
3. Scroll one digit to the right using ▶ and increase value of digit by 1 using ▲. Confirm with SET or abort entry with ESC.
4. Return to Standard data with ESC and use ▶ or ▲ to continue to Pressure process data.
Editing pressure process data
Setting of the process data for the Pitot tube calculation.

1. Select **Pressure process data** with ▶ or ▲ and confirm selection with **SET**.

2. Select the required variable (absolute pressure/humidity/temperature/cross-section/Pitot tube factor/correction factor) with ▶ or ▲, confirm selection with **SET** or cancel with **ESC**.

3. Scroll one digit to the right using ▶ and increase value of digit by 1 using ▲. Confirm with **SET** or abort entry with **ESC**.

4. Return to **Pressure process data** with **ESC** and use ▶ or ▲ to continue to **Humidity process data**.

Editing Humidity process data
This menu is only used to parameterize humidity measurements in H₂O₂ atmospheres (e.g. in sterilization processes) and determines whether °Ctm or °Ftm is the output parameter.

1. Select **Humidity process data** with ▶ or ▲ and confirm selection with **SET**.

2. Select **H₂O₂ weight prop.** with ▶ or ▲, confirm selection with **SET** or cancel with **ESC**.

   The selection **H₂O₂ water** or **H₂O₂ vapour** in the submenu describes whether H₂O₂ is generated by means of evaporation or is actively vaporized in the process.

3. Select **H₂O₂ water** or **H₂O₂ vapour** with ▶ or ▲ and confirm with **SET**.

4. Edit proportion by weight of the H₂O₂ in % (% H₂O₂ proportion by weight in the liquid initial solution): Scroll one digit to the right using ▶ and increase value of digit by 1 using ▲. Confirm with **SET** or abort entry with **ESC**.

5. Return to **H₂O₂ weight prop.** with **ESC** and use ▶ or ▲ to continue to **Humidity process pressure**.

6. Select **Humidity process pressure** with ▶ or ▲ and confirm selection with **SET**.

7. Edit humidity process pressure: Scroll one digit to the right using ▶ and increase value of digit by 1 using ▲. Confirm with **SET** or abort entry with **ESC**.

8. Return to **Change parameters** with **ESC**.

9. Return to **Main Menu Settings** with **ESC**.
4.4.6.6. **Editing Main Menu Analysis**

You can test the functionality of analog and relay outputs. In addition, you can read off the minimum and maximum values (since the last voltage supply or reset of the min./max. values).

**Testing functionality of analog outputs**

- This function affects the analog outputs directly, not only the test contacts.

1. In the Measuring Mode press SET, select main menu Analysis with ▶ or ▲ and confirm selection with SET.

- **Test Analog Output** is shown.

2. Press SET and choose between Analog output 1, 2, 3 with ▶ or ▲.

3. Press SET, scroll one digit to the right using ▶ and increase value of digit by 1 using ▲. Any analog output value can be predefined, e.g. for an analog output of 4 to 20 mA, the value "6.0 mA". Confirm with SET or abort entry with ESC.

4. Accept setting by pressing SET and test with multimeter (minimum requirement: resolution 6.5 digits, at least 2-times more accurate than the 6381) as follows:

   Analog output 1 or 2: Via test contacts under service flap, see diagram.

   Analog output 3: Connect measuring cables to terminals for channel 3, guide measuring cables out of housing and perform measurement outside of the transmitter, see diagram.

5. Return to **Test Analog Output** with ESC and use ▶ or ▲ to continue to Test Relay Output.
Testing functionality of the pressure sensor (Test pressure sensor)

This function is only required to calibrate the pressure sensor.

Testing functionality of relay outputs

1. Press SET and choose between Alarm 1, 2, 3, 4 with ▶ or ▲.
2. Press SET.
   
   The relay can now be tested. You can choose between OFF and ON using ▶ or ▲. If ON is chosen, the NO contact is closed, the NC contact opened. If OFF is chosen, the NC contact is closed, the NO contact opened.
3. To test, route a measuring cable from the relay terminals (see Connecting the relay outputs, page 29) out of the transmitter to a multimeter (resistance measurement) or continuity tester.
4. Return to Test Relay Output with SET (starts relay test) or ESC (exits the menu without relay test).

Reading off min./max. values of channels

To reset the max./min. values, see Editing Reset main menu, page 79

1. Read off the min./max. values of the three channels in succession with ▶ or ▲ and return to the Main Menu Analysis with ESC.
2. Continue to Main Menu Message with ▶ or ▲ or return to Measuring Mode with ESC.
4.4.6.7. Editing Message main menu

Messages can be confirmed/acknowledged, the last messages can be called up and the display of the messages can be switched on or off.

1. Operating hours at the time of message
2. Message code (see Status, warning and error messages, page 79).
3. Message text
4. Message number (example: "4/7" refers to the fourth of seven messages)
5. Number of messages present (example: "4/7" refers to the fourth of seven messages)

Using the P2A software (see volume 2, Parameterizing, adjusting and analyzing software (P2A software), page 128) you can predefine whether messages are to be shown in the display.

1. In the Measuring Mode press SET, select Main Menu Message with † or ‡ and confirm selection with SET.
2. Confirm Confirm message using SET.
3. Select Last messages with † or ‡ and confirm with SET.
4. Scroll between the warning and error messages recorded so far using † or ‡ and return to Last messages using ESC.
5. Select Information with † or ‡ and confirm with SET.
6. Scroll between the status messages recorded so far using † or ‡ and return to Information using ESC.
7. Continue to Display of message with † or ‡.
   - ON: Measurements are shown on the display in Measuring Mode.
   - OFF: No messages shown on display.
8. Select ON or OFF with † or ‡ and confirm selection with SET.
9. Return to Main Menu Message with ESC.
10. Continue to **Main Menu Ident** with ▶ or ▲ or return to Measuring Mode with **ESC**.

![An overview of the messages can be found in Status, warning and error messages, page 79](image)

### 4.4.6.8. Calling up Main Menu Ident

![Diagram of Main Menu Ident](image)

1. Instrument or probe type
2. Build number
3. Firmware version
4. Serial number

The serial numbers of the transmitter and probe can be read off.

1. In the Measuring Mode press **SET**, select **Main Menu Ident** with ▶ or ▲ and confirm selection with **SET**.

   - The type, firmware version, build number and serial number of the transmitter are displayed.

   ![This information is required when servicing.](image)

2. Return to **Main Menu Ident** with **ESC** or read off the type, firmware release, build number and serial number of the probe with ▶ or ▲ and then return to **Main Menu Ident** with ▶ or ▲.

3. Continue to **Main Menu Adjust** with ▶ or ▲ or return to Measuring Mode with **ESC**.

### 4.4.6.9. Editing Main Menu Adjust

A reference value can be entered for both relative humidity (RH) and temperature (°C/°F) for the 1-point adjustment. Please refer to the description in 1-point adjustment (offset - humidity/temperature), page 51

Reference values for pressure can be entered for the n-point adjustment. Please refer to the description in n-point adjustment (pressure), page 56
In addition, the analog outputs can be adjusted. Also see Analog output adjustment, page 55 for instructions on how to do this.

The 2-point adjustment cannot be performed via the user menu. This is done using the adjustment buttons or the P2A software, see 2-point adjustment (humidity/temperature), page 53 or volume 2, 2-point adjustment, page 154.

**Enter reference value for 1-point adjustment**

Please also refer to 1-point adjustment (offset - humidity/temperature), page 51

1. In the Measuring Mode press SET, select main menu Adjust with ▶ or ▲ and confirm selection with SET.

   - **Reference value % RH** is displayed.

2. Press SET, edit value: Scroll one digit to the right using ▶ and increase value of digit by 1 using ▲. Confirm with SET or abort entry with ESC.

3. Continue to **Reference value temp** with ▶ or ▲.

4. Press SET, **Reference value °C** or **Reference value °F** is displayed.

5. Press SET, edit value: Scroll one digit to the right using ▶ and increase value of digit by 1 using ▲. Confirm with SET or abort entry with ESC.

6. Continue to **Analog Adj. Ch. 1** with ▶ or ▲.

7. Continue with the adjustment of the analog outputs (see below, step 2) or press ESC to return to main menu Adjust.

8. Continue to main menu Reset with ▶ or ▲ or return to Measuring Mode with ESC.

**Performing analog adjustment**

Please refer to Analog output adjustment, page 55

1. In the Measuring Mode press SET, select main menu Adjust with ▶ or ▲ and confirm selection with SET.

   - Each channel is adjusted at three points in the analog range (at 10 %; 50 %; 90% of the analog scale).

2. Select **Analog Adj. Ch. 1** with ▶ or ▲ and confirm with SET.

3. Use ▶ or ▲ to select **Adj. Point 1**.

4. Press SET. Read off multimeter display (e.g. 5601 mA) and enter this value in the user menu. Do this by scrolling one digit
to the right using ▶ and increasing the value of digit by 1 using ▲. Confirm with SET or abort entry with ESC.

5. Use ▶ or ▲ to select Adj. Point 2.

6. Press SET. Read off multimeter display (e.g. 12,001 mA) and enter this value in the user menu. Do this by scrolling one digit to the right using ▶ and increasing the value of digit by 1 using ▲. Confirm with SET or abort entry with ESC.

7. Use ▶ or ▲ to select Adj. Point 3.

8. Press SET. Read off multimeter display (e.g. 18,401 mA) and enter this value in the user menu. Do this by scrolling one digit to the right using ▶ and increasing the value of digit by 1 using ▲. Confirm with SET or abort entry with ESC.

9. With ▶ or ▲ continue to Analog Adj. Ch. 2 or 3 (repeat steps 3 to 8).

10. Return to main menu Adjust with ESC.

11. Continue to main menu Reset with ▶ or ▲ or return to Measuring Mode with ESC.

Performing the pressure adjustment

Please refer to n-point adjustment (pressure), page 56

1. In the Measuring Mode press SET, select main menu Adjust with ▶ or ▲ and confirm selection with SET.

2. Select Adjust Pressure with ▶ or ▲ and confirm with SET.

3. Use ▶ or ▲ to select Adj. Point 1.

4. Press SET. Read off pressure sensor display (e.g. 30.1 Pa) and enter this value in the user menu. Do this by scrolling one digit to the right using ▶ and increasing the value of digit by 1 using ▲. Confirm with SET or abort entry with ESC.

5. Repeat steps 1 to 4 for adjustment points 2 to 6.

6. Return to main menu Adjust with ESC.

7. Continue to main menu Reset with ▶ or ▲ or return to Measuring Mode with ESC.
4.4.6.10. **Editing Reset main menu**

You can reset the factory settings for the following:

- Instrument
- Sensor/probe
- Min./max. values

Resetting to the factory settings means resetting to the order specification, i.e. the specific condition at the time of supply to the customer.

1. In the Measuring Mode press SET, select **Main Menu Reset** with ▶ or ▲ and confirm selection with SET.

   - **Reset Device** to factory settings is displayed.

2. Select the setting to be reset using ▶ or ▲ and confirm selection with SET.

   - **Reset Completed** is displayed.

3. Return to the reset setting with ESC or SET and return to **Main Menu Reset** with ESC.

4. Continue to **Main Menu Channel 1** with ▶ or ▲ or return to Measuring Mode with ESC.

4.5. **Status, warning and error messages**

To achieve optimum operational reliability (machine availability), the transmitter shows the following via the user menu or the P2A software:

- Status messages
- Warning messages
- Error messages

The status and warning messages for the respective testo 6610 probes connected to the transmitter can be evaluated via the P2A software.

All messages are stored in the transmitter with an operating hours stamp. Use the user menu (see Editing Message main menu, page 75) or the P2A software (see volume 2, Transmitter history, page 157) to view the message history.

In the transmitter, the last 60 status messages and the last 120 error and warning messages are stored in a ring memory. There is no limit in the P2A software.
### 4.5.1. Status messages

Status messages show the current operating status of the testo 6381.

</tr>
</tbody>
</table>

If multiple messages/alarms are activated at the same time, only the last message/alarm is shown. If this is cancelled, the other messages that are still active are no longer displayed.

The message can be assigned the collective alarm function, which means that the collective alarm is activated as soon as at least one of the messages assigned to it is activated. The collective alarm can be assigned to each of the 4 optional relays. The collective alarm is then always the same, as it can only be defined once.

The message is shown upon the occurrence of the event causing the message as well as when closing. Two entries appear in the history in the P2A software: Message text_start and Message text_end.
Perform the Confirm message function (acknowledgement of the alarm via the control keys on the transmitter):

- The message/alarm is no longer shown on the display and the optical alarm goes out, where applicable. If multiple messages/alarms are active at the same time, all are reset simultaneously.
- If at least one message is assigned to the collective alarm, the collective alarm is reset. If the collective alarm is set on a relay, the relay is also reset, meaning switched to its neutral position.

### 4.5.5. **Namur fault conditions**

If the faults named in the following table occur, the analog outputs output special values that enable a general fault warning in the higher-level control system. The values correspond to the "Namur" industry standard.

<table>
<thead>
<tr>
<th>Status message in the display</th>
<th>Display value in display</th>
<th>Class</th>
<th>Analog output</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td>0 to 20 mA</td>
</tr>
<tr>
<td>No probe signal</td>
<td>None</td>
<td>Error</td>
<td>21 mA</td>
</tr>
<tr>
<td>Wrong probe</td>
<td>None</td>
<td>Error</td>
<td>21 mA</td>
</tr>
<tr>
<td>Values &lt; 0 %RH</td>

</tr>
<tr>
<td>Pressure too high</td>
<td>ooooo</td>
<td>Overrange</td>
<td>20.5 mA</td>
</tr>
</tbody>
</table>
4.6. Maintenance and cleaning

4.6.1. Maintaining the instrument

We recommend that the adjustment and settings of the transmitter be checked at regular intervals using the

- User menu (Operation, page 60) or
- P2A software (volume 2, Parameterizing, adjusting and analyzing software (P2A software), page 128)

Convenient "remote monitoring" of the transmitter can be implemented, for example by using a relay as a collective alarm (see Using alarm as collective alarm or not using it at all, page 68) whose messages are forwarded to a local alarm transmitter (horn, light) or PLC.

4.6.2. Cleaning the instrument

- Only clean the instrument carefully with a moist cloth.
- Do not use aggressive cleaning agents.
- Do not use any solvents.
